

WHITE PAPER / VERSION 2.0 / OCTOBER 3, 2026

Burn \$MORE. Forge your power.

Lock principal. Add an optional permanent burn. Participate in four payout pools.

MORE Forge V2

MORE Forge V2 gives participants two choices: lock MORE alone, or lock MORE and permanently burn additional MORE for extra power. Each position can participate in the 8-, 28-, 88- and 288-day payout pools while it has eligible power at their deadlines. There is no separate Foundry mint.

The locked principal can be withdrawn after maturity. Optional burned MORE is sent immediately to the dead address and cannot be returned. These are separate amounts and the website shows them separately before approval.

Core mechanic	V2 rule
Principal	Positive MORE amount locked for an integer 8-1,000 days
Optional extra burn	Zero to three times principal; permanently sent to the dead address
Power	Principal + duration bonus + optional burn
Protocol fee	Principal-based native fee; current percentage and bounds read on-chain
Fee allocation	84% rewards / 15% token buy-and-burn / 1% development
Bitcoin funding	Bought during the entry transaction

Deployment status at publication

Robinhood Chain V2 is deployed and independently checked against the prepared bytecode, receipts and wiring. Entries are paused pending the owner's opening transaction. PulseChain V2 is not yet confirmed and its addresses are not published here. The live website and public manifest show the latest status.

V2 uses new contracts. V1 positions are not migrated automatically. The **V1 application** retains access to existing rewards and the original V1 rules. Ethereum and Avalanche remain inactive future networks. Chains operate independently.

Choose what to lock. Choose what to burn.

Lock plus burn: additionally choose burn B, between zero and 3P. The exact extra burn goes to 0x00000000000000000000000000000000dEaD during entry. Sending tokens there does not necessarily reduce the token contract's reported totalSupply.

P and B use MORE base units; D is whole days. The duration bonus is zero at 8 days and equals principal at 1,000 days. There is no separate fee-contribution bonus.

In the final example, the participant supplies 400 MORE in total, of which only 100 MORE is withdrawable principal. The 500 power is five times principal, not five times all MORE supplied. Power is a proportional weight, not a promised return.

A transferable position NFT records principal, initial power and maturity. Transferring an open NFT gives the recipient the locked principal and unclaimed and future reward rights. Withdrawal or full-expiry finalization closes the position and burns the NFT. Historical rewards remain claimable by the recorded final owner.

The website requests approval for principal plus optional burn, then a separate entry confirmation. It rechecks the wallet, chain, balance, entry pause and fee after approval. A changed fee needs a fresh review. Entry atomically transfers principal, optional burn and fee, and purchases the Bitcoin allocation. If the required swap or quote fails, entry reverts. Separate approval transactions and gas already spent are not reversed.

02 / WITHDRAWAL

Claim principal after maturity.

Withdrawal timeline

Time relative to maturity	Principal and power
Before maturity	No withdrawal; full power while the position remains open
Maturity through the following 7 days	Full principal is withdrawable; full power remains until closure
Following 7 days	Remaining principal and power decline linearly to zero
Maturity + 14 days onward	Nothing remains withdrawable; anyone can finalize expiry

During decay, the remaining amount equals $\text{floor}(\text{original amount} \times \text{remaining decay seconds} / 604,800)$. The contract applies integer base-unit arithmetic separately to principal and power. Closing a position returns its remaining principal to its owner and sends the forfeited portion to the dead address. The optional entry burn is never returned.

Example: 100 MORE principal

Withdraw at maturity or during the first 7 days: 100 MORE returned.

Withdraw 10.5 days after maturity: approximately 50 MORE returned, 50 MORE forfeited.

At 14 days: zero principal remains; the full 100 MORE is forfeited.

Exact amounts use transaction timestamps and integer rounding.

Anyone may finalize a fully decayed position. The finalizer cannot take the principal: forfeited MORE is sent to the dead address. Entry pauses do not prevent existing positions from withdrawing or finalizing.

Deadline eligibility

Reward power is measured at each pool's scheduled deadline. A position created at that exact deadline is excluded. A position closed at or before a deadline has no power for that cycle. An open position in its decay period contributes its remaining power at the deadline. A position fully decayed before the deadline earns no share.

All positions have access to all four pools, but a short lock does not automatically qualify for a distant 288-day deadline. Withdrawing ends future power. Already-earned rewards remain claimable and do not expire.

03 / FEES AND ALLOCATIONS

Fees fund recurring pools.

Principal-based protocol fee

The fee values locked principal using the configured main MORE liquidity pool's on-chain spot ratio. Optional burned MORE and duration do not increase the protocol fee. Header USD prices are references, not the contract's fee oracle. There is no price averaging.

Starting fee policy	Robinhood	PulseChain target
Principal spot value charged	100%	100%
Minimum fee	0.001 ETH	200,000 PLS
Maximum fee	1 ETH	200,000,000 PLS

Robinhood settings were verified from the deployed V2 contract. PulseChain values are the prepared configuration until its deployment is confirmed. The owner can change fee percentage and bounds. The entry transaction requires the current exact fee; gas is additional.

Destination	Share of native protocol fee
8-day native payout pool	26.88%
28-day native payout pool	22.68%
88-day native payout pool	17.64%
288-day Bitcoin-token payout pool	16.80%
FUEL buy-and-burn	5%
MORE buy-and-burn	5%
PAMP buy-and-burn	5%
Development	1% plus indivisible rounding dust

The routing destinations and allocations are fixed in the deployed fee router. Allocations are rounded down to native base units and the development recipient receives the remainder. Native rewards are ETH on Robinhood and PLS on PulseChain; Bitcoin rewards are cbBTC and wBTC respectively.

Bitcoin purchased on entry

The 16.8% Bitcoin allocation is converted in the same entry transaction. Minimum-output checks, per-swap limits and a maximum of 32 conversion chunks apply. Robinhood starts with a 0.5 ETH per-chunk cap; the prepared PulseChain cap is 1,000,000 PLS. A failed conversion reverts the whole entry. Output depends on liquidity and execution prices.

04 / CYCLES AND OPERATION

Settle. Claim. Repeat.

Cycle schedule

The Robinhood anchor is October 3, 2026 at 17:00 UTC (1 PM Eastern daylight time). The first 8-, 28-, 88- and 288-day deadlines are October 11, October 31, December 30, 2026 and July 18, 2027, all at 17:00 UTC. The first cycles include the hours between opening entries and the anchor when opening occurs before the anchor.

Later cycles repeat at fixed UTC intervals. 17:00 UTC is 1 PM Eastern during daylight saving and noon Eastern during standard time. The website displays local dates and times. The prepared PulseChain deployment also uses a 17:00 UTC anchor; its final confirmed date will be published separately.

Settlement and claims

After a funded cycle closes, anyone can process its position snapshot and receive a 0.25% settlement incentive. Rewards are proportional to eligible deadline power. A zero-power cycle carries its funding forward. The website processes up to 15 position records per pool per batch across four pools; larger snapshots need further calls. Up to 20 reward records can be claimed together.

Claims do not auto-transfer, and earned rewards do not expire. Native-pool settlement incentives are paid in native coin; the Bitcoin pool pays its incentive in its reward token. Estimated payouts account for the incentive, but final rewards use the completed on-chain snapshot.

Token buy-and-burn

Each token receives 5% of protocol fees. Burn pools operate on 10-minute intervals and start at a 1% daily drip. Anyone can execute an eligible burn and receive 1.5% of its native execution amount. The rest buys the selected token and sends it to the dead address. Gas can exceed the caller incentive.

Owner controls and practical limits

The owner controls entry pauses, fee policy, burner daily drip (1-10%), swap caps and bounded slippage. The owner cannot change the fixed fee-router allocations or the principal/power formula. Entry pauses do not block withdrawal, NFT transfers, settlement or claims.

Pool funding, prices and competing power change; returns are not guaranteed. Spot ratios can move sharply or be manipulated. Liquidity or minimum-output checks can make transactions fail. Local and fork tests and deployment bytecode checks are validation, not an independent security audit.

APPENDIX / ROBINHOOD CHAIN

Verified V2 contracts.

Chain ID 4663 / native ETH / Bitcoin reward token cbBTC

Verified at deployment block 79018317. Entries were paused at publication. Explorer links identify addresses; they do not claim explorer source-code verification.
