

# FUEL FORGE

AVALANCHE MAINNET

## Fuel Forge Protocol White Paper

Regular FUEL stakes for AVAX, Foundry NFTs for BTC.b, and FUEL and MORE buy-and-burn pools.

### VERSION 1.0 - 6 OCTOBER 2026

Live Avalanche Mainnet edition. The wallet-approved deployment is confirmed and the public interface is connected to the deployed contracts. This revision records the final settings and deployed address registry as of 6 October 2026. Source verification is separate from deployment confirmation; consult each native explorer Code tab for its current status.

[thefuelforge.com/avalanche/](https://thefuelforge.com/avalanche/)

# 01 Overview and release status

A regular Fuel Forge stake locks FUEL principal in a transferable position NFT. The holder may permanently burn additional FUEL for more reward power. Fees from opening positions fund three AVAX reward cycles, one 288-day BTC.b reward cycle, FUEL and MORE buy-and-burn pools, and a development allocation. There is no PAMP burn allocation. Bitcoin rewards use a separate Foundry NFT: each mint permanently burns 100 million FUEL.

The Avalanche contracts are deployed and the public website is live at [thefuelforge.com/avalanche/](https://thefuelforge.com/avalanche/). Regular positions earn AVAX. Separate Foundry NFTs earn BTC.b in their mint cycle only. Chain-specific assets and reward balances do not migrate between deployments.

| Component             | Avalanche live deployment                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------|
| Regular position      | Lock FUEL for 8-1,000 days; optional permanent FUEL burn; transferable NFT                |
| Reward cycles         | 8-, 28-, and 88-day AVAX pools for regular positions; 288-day BTC.b pool for Foundry NFTs |
| Buy and burn          | FUEL and MORE only; 10-minute execution intervals                                         |
| Administrator control | Only each burn pool's daily drip, constrained to 1%-10%                                   |

## NO PROMISED YIELD

Reward amounts depend on fee inflows, eligible historical power, actual swaps and settlement transactions. Preview estimates are illustrative and are not on-chain entitlements.

# 02 Position creation and fees

A position locks a positive FUEL principal for a whole-number term from 8 through 1,000 days. The creator can also burn up to three times that principal. Longer terms and the optional burn raise initial reward power. The NFT represents the stake and its unclaimed reward rights; transferring it changes who controls those rights without resetting the term.

The Avalanche entry fee is fixed at 100% of the AVAX value quoted for the locked FUEL principal. There is no minimum or maximum fee clamp. The optional extra FUEL burn does not increase the fee. A zero oracle quote or incorrect AVAX payment rejects creation. Network gas is additional. The token, oracle and fee receiver are immutable deployment inputs, the deployed oracle and receiver are listed in this edition.

## INITIAL POWER

$$\text{Power} = \text{principal} + \text{floor}(\text{principal} \times (\text{termDays} - 8) / 992) + \text{optional burned FUEL}$$
  
The term bonus is at most one principal and the extra burn is at most three principals, so initial power is at most five times principal.

## 03 Maturity and withdrawal

There is no early principal withdrawal. At maturity, a seven-day grace period begins during which principal remains fully withdrawable. During the following seven days, principal and power decay linearly to zero. Once the decay period ends, no principal can be recovered. A withdrawal or expiry finalization closes the NFT; earned but unclaimed rewards remain assigned to the current or recorded final owner.

| Time                             | Principal available    | Future reward power               |
|----------------------------------|------------------------|-----------------------------------|
| Before maturity                  | Withdrawal unavailable | Positive while otherwise eligible |
| Maturity through seven days late | Full principal         | Full initial power until closure  |
| Seven to fourteen days late      | Declines linearly      | Declines linearly until closure   |
| Fourteen days late or later      | Zero                   | Zero                              |

## 04 AVAX and Bitcoin rewards

The three AVAX reward pools have 8-, 28-, and 88-day cycles. The separate Foundry has a 288-day cycle paying BTC.b. Each Foundry NFT permanently burns 100,000,000 FUEL. Regular stakes do not automatically earn Bitcoin. For AVAX rewards, a regular position must exist before the deadline and have positive historical power at that deadline. A position already withdrawn or fully decayed at the deadline is ineligible for that AVAX cycle. Foundry BTC.b eligibility instead follows the NFT's mint cycle, not regular-stake power.

At an AVAX cycle close, anyone can process the historical position snapshot in bounded batches. Foundry BTC.b settlement uses its fixed per-cycle NFT count without scanning regular stakes. A fixed 0.25% of the gross pool is reserved for the callers processing those batches; 99.75% remains for participants. Each eligible regular position's AVAX share is proportional to power at the deadline. Each Foundry NFT instead earns one equal share of the BTC.b pool for its mint cycle only. Foundry NFTs are transferable and their unclaimed reward rights follow the current NFT owner. Settlement is allowed only after that timestamp; late settlement does not move the deadline.

Anyone may trigger a claim, but payment goes to the current NFT owner or the recorded final owner if the position has closed. Claims do not expire in the deployed contracts. Empty cycles and indivisible rounding dust roll forward. A Foundry mint charges 100% of the oracle-quoted AVAX value of the burned FUEL, with no fee clamps. Its fee sends 1% to development and 99% to BTC.b purchases. Regular position fees also contribute their fixed 14.8% allocation to the Foundry pool. The Foundry converts AVAX funding into BTC.b using protected swaps. A conversion is split into chunks of at most 10 AVAX, with 10% maximum slippage and fresh quotes; a single conversion call is limited to 32 chunks. Failed swaps retry in smaller protected chunks, up to 32 successful swaps and 64 attempts. Exhausting those limits rolls back the entire funding or mint transaction.

## 05 Immutable fee distribution

Each position fee is routed atomically across the seven destinations below. The percentages, recipients and absence of a PAMP destination are fixed in the Avalanche router. For each payment, non-development allocations round down to whole wei; the development recipient receives the residual wei, nominally 1% plus rounding dust.

| Destination        | Share of position fee | Purpose                                   |
|--------------------|-----------------------|-------------------------------------------|
| 8-day AVAX pool    | 23.68%                | Regular position rewards                  |
| 28-day AVAX pool   | 19.98%                | Regular position rewards                  |
| 88-day AVAX pool   | 15.54%                | Regular position rewards                  |
| 288-day BTC.b pool | 14.80%                | Equal Bitcoin shares for Foundry NFTs     |
| FUEL burn pool     | 15.00%                | Buy and permanently burn FUEL             |
| MORE burn pool     | 10.00%                | Buy and permanently burn MORE             |
| Development        | 1.00% nominal         | Development wallet and rounding remainder |

The reward allocations total 74%, burn allocations total 25%, and development receives the remaining 1%. If a required receiver rejects its AVAX allocation, the whole entry reverts rather than partially routing its fee.

## 06 Buy-and-burn execution

The FUEL and MORE burn engines accrue executable AVAX on 10-minute intervals. Their daily drip starts at 1% of each pool balance. The one retained administrator control changes the daily drip for each burn pool only within 1%-10%. The burn contracts have no owner fee setter, swap-cap setter, slippage setter, adapter replacement or upgrade path in the deployed contracts.

Anyone can execute an eligible burn and receives a fixed 1.5% caller reward from the gross AVAX used by that execution. The rest is swapped for the target token and sent to the burn address. Each execution uses at most 10 AVAX gross, with a fixed 10% slippage ceiling and a fresh quote. If available AVAX exceeds the cap, the unspent amount remains queued for later executions. A failed protected swap rolls back the execution.

## 07 Cycle schedule and live price references

Current pool prices are primary, with historical checks. FUEL, MORE and BTC.b use current concentrated-liquidity pool prices checked against 15-minute observations. FUEL and MORE use Uniswap V3 routes; BTC.b uses the selected Pharaoh concentrated-liquidity route. The FUEL entry quote permits same-pool spot fallback only for PriceOutsideAverage. Missing history and other quote errors still reject. Burn and Bitcoin conversion references remain checked. Liquidity checks require nonzero liquidity; there is no half-snapshot liquidity cutoff. Routes and oracles cannot be replaced by the manager.

FUEL is 0x06A22D45e7bf93d56B6f940b9Cc6c401EDF43d71. Its FUEL/WAVAX V3 pool is 0x2431DFC276Af9c5c3BB5a091D2bE19Cf518e2467. The BTC.b/WAVAX Pharaoh route is 0x5cA009013F6B898D134b6798B336A4592f3B4aF2. The immutable cycle anchor is October 6, 2026 at 17:00 UTC (1 PM EDT). Entries opened after deployment later that day, making the first cycles shorter. Subsequent cycles use exact 24-hour days, keeping deadlines at 17:00 UTC: 1 PM EDT and noon EST. First closes are October 14, November 3, 2026, January 2 and July 21, 2027 for the 8-, 28-, 88- and 288-day pools respectively.

## 08 Live contract registry

The addresses below are from the confirmed deployment and public site configuration. Wallet transactions created the contracts; the helper cannot repeat the final deployment. Source verification status should be checked on [snowtrace.io](https://snowtrace.io) for each address.

The deployed Avalanche suite uses direct contracts with immutable wiring and swap routes. The burner manager can only change each daily drip within 1%-10%; there is no manager upgrade, route-replacement or fee-policy setter.

| Role                             | Avalanche address                          |
